

WEEK 01

Technical Environmental Systems Weekly Submissions

A short summary about the conductive heat transfer and solving the same exercise with $L = 0.4 \text{ m}$, $A = 20 \text{ m}^2$, $\Delta T = 25$, and $K = 0.78 \text{ W/mK}$ using both simple method and using the resistance concept.

$A = 20 \text{ m}^2$
 $L = 0.4 \text{ m}$
 $\Delta T = 25^\circ \text{C}$
 $K = 0.78 \text{ W/mK}$

- The heat transfer through the wall can be simulated as steady and one-dimensional. The temperature of the wall in this case depends on one direction and can be expressed as $T(x)$. $x \rightarrow T(x)$ is a linear function. In the steady operation, the rate of heat transfer through the wall is constant.

Simple Method

$$\begin{aligned} Q &= KA \frac{\Delta T}{L} \\ &= 0.78 \text{ W/mK} \times 20 \text{ m}^2 \times \frac{25 \text{ K}}{0.4 \text{ m}} \\ &= 975 \text{ W} \end{aligned}$$

Resistance Concept

$$\begin{aligned} R &= \frac{L}{KA} \\ &= \frac{0.4 \text{ m}}{0.78 \text{ W/mK} \times 20 \text{ m}^2} \\ &= 0.0256 \text{ K/W} \end{aligned}$$

$$\begin{aligned} Q &= \frac{\Delta T}{R} \\ &= \frac{25 \text{ K}}{0.0256 \text{ K/W}} \\ &\approx 975 \text{ W} \end{aligned}$$
